Normally Sprinter engine revs are ECU limited whilst stationary to around 3500 rpm. Depressing the clutch and then further releasing it should now allow revs to increase above this range to the rev limit. If there is a limp home fault, engine revs will not progress above 3000 rpm even when dipping/releasing the clutch when stationary.

Using a scan tool, check if, when engine is running or cranking, that there is an RPM signal. If there is no RPM reading, then visually inspect the crank sensor and connector for any damage and repair as necessary. If there is no visible damage, and you have access to a scope, you could check the CKP 5 Volt square wave pattern.

P0335 Crankshaft Position Sensor A Circuit Malfunction ...

Nope. Dead CKP sensors are VERY common on newer MB products, actually have been for years, and they never set a DTC. Reason is, the ECU on those does not know the engine is "trying" to be cranked. It simply sees no RPM signal, so it won't inject fuel/spark the plugs (on gassers), etc. It just sees the key is on, that's it.
