F1 Engine Rocket

The F-1 is a gas-generator cycle rocket engine developed in the United States by Rocketdyne in the late 1950s and used in the Saturn V rocket in the 1960s and early 1970s. Five F-1 engines were used in the S-IC first stage of each Saturn V, which served as the main launch vehicle of the Apollo program.

In addition to its duties in sustaining proper combustion, the injector also played a role in the initial ignition of the engine. The F-1's propellants, RP-1 and LOX, require an external ignition source to initiate combustion.

The rocket will have constant 100% thrust, and the power will vary with speed. This works out to have some odd results. Each F1 engine produced 1,522,000 lbf of thrust on the pad--but the propulsive power of any rocket engine is zero until the craft starts moving.

An engine like the F-1 is sort of like two separate rocket engines: one small, one large. The smaller one consumes the same fuel as the larger, but its rocket exhaust is not used to lift the vehicle; instead, it drives the enormous turbopump that draws fuel and oxidizer from the tanks and forces them through the injector plate into the main ...
