Engine Coolant Temperature Sensor-(ECT) The engine coolant temperature sensor-(ECT) is a sensor that is used to monitor the temperature of the engine's coolant. Most (ECT) sensors operate using electrical resistance to measure the temperature of the coolant. The readings from the (ECT) sensor are sent back to the engine control unit (ECU).

Working principle of the ECT sensor In order to convert the ECT resistance variation to voltage variation, which is further processed by the ECU, the ECT sensor is connected in a circuit typically supplied with a reference voltage of +5V. In cold engine and an ambient temperature of 20 °C the sensor resistance is between 2000Ω and 3000Ω.

The ECT ECU has lock-up clutch operation pattern for each driving mode (Normal and Power) programmed in its memory. The ECU turns the No. 3 solenoid valve on or off according to vehicle speed and throttle opening signals. The lock-up control valve changes the fluid passages for the converter pressure acting on the torque converter piston to engage or disengage the lock-up clutch.

When the engine coolant is below a predetermined temperature, the engine performance and the vehicle's drivability would suffer if the transmission were shifted into overdrive or the converter clutch were locked-up. The engine ECU monitors coolant temperature and sends a signal to terminal OD1 of the ECT ECU.
