A water-cooled cooling system. A water-cooled engine block and cylinder head have interconnected coolant channels running through them. At the top of the cylinder head all the channels converge to a single outlet. A pump, driven by a pulley and belt from the crankshaft, drives hot coolant out of the engine to the radiator, which is a form of heat exchanger.

The best way to get an idea of how the system works is to trace the hoses that can be seen using the service manual where they enter and exit the engine and exhaust system. Much of the cooling system cannot be seen as it is running through water jackets around the cylinders, through the exhaust manifold, and inside the exhaust system.

Internal combustion engine cooling uses either air or liquid to remove the waste heat from an internal combustion engine. For small or special purpose engines, cooling using air from the atmosphere makes for a lightweight and relatively simple system. Watercraft can use water directly from the surrounding environment to cool their engines.

I purchased a used 2007 Nissan Pathfinder with extended warranty for my daughter on 12/28/13. Last week the check engine light came on. She made an appointment, arrived early and 5 hours later was told that a sensor needed to be replaced and suggested that she take it to a Nissan dealer as they had equipment specific to Nissan vehicles and her warranty covers the work at any dealership.
