Let's do a couple of word problems dealing with exponential growth and decay. So this first problem, suppose a radioactive substance decays at a rate of 3.5% per hour. What percent of the substance is left after 6 hours? So let's make a little table here, to just imagine what's going on. And then we ...

Whenever you see the phrase relative growth rate, continuous growth rate, or exponential growth rate, you know you're dealing with exponential behavior. As discussed in Exponential Growth and Decay: Introduction, all exponential growth/decay problems can be modeled using  $P(t) = P_0 e^{rt}$ , where  $P_0$  is the initial amount,  $r$  is the growth or decay rate, and  $t$  is time.

**Solving Exponential Growth and Decay Problems**

Exponential word problems almost always work off the growth / decay formula,  $A = Pe^{rt}$ , where "A" is the ending amount of whatever you're dealing with (money, bacteria growing in a petri dish, radioactive decay of an element highlighting your X-ray), "P" is the beginning amount of that same "whatever", "r" is the growth or decay rate, and "t" is time.

And, the beauty of  $e$  is that not only is it used to represent continuous growth, but it can also represent growth measured periodically across time (such as the growth in Example 1). In Algebra 2, the exponential  $e$  will be used in situations of continuous growth or decay. The following formula is used to illustrate continuous growth and decay.

Exponential functions tell the stories of explosive change. The two types of exponential functions are exponential growth and exponential decay. Four variables — percent change, time, the amount at the beginning of the time period, and the amount at the end of the time period — play roles in exponential functions. This article focuses on how to use word problems to find the amount at the ...
