Engine-driven fans come in three types: solid, clutch, and flex. Solid fans. A solid fan is the most basic type: four to seven metal or plastic blades, criss-crossed around a central hub, bolted onto the water pump pulley. The speed of the pulley, driven by a fan belt, is the speed of the fan; when the engine runs faster, the fan runs faster.

The turbofan or fanjet is a type of airbreathing jet engine that is widely used in aircraft propulsion. The word "turbofan" is a portmanteau of "turbine" and "fan": the turbo portion refers to a gas turbine engine which achieves mechanical energy from combustion, and the fan, a ducted fan that uses the mechanical energy from the gas turbine to accelerate air rearwards.

A radiator fan helps in the vehicle's cooling process and draws air into the radiator to prevent the engine from overheating. Since the radiator cannot do the job of cooling down the engine on its own, a radiator fan is positioned between them so that a greater amount of air will flow easily into the radiator.

A fan clutch is a thermostatic engine cooling fan that can freewheel at low temperatures when cooling is not needed, allowing the engine to warm up faster, relieving unnecessary load on the engine. As temperatures increase, the clutch engages so that the fan is driven by engine power and moves air to cool the engine.

temperature. But Peltier fans will auto start, which is a useful feature. The Stirling engine fans, however, usually move more air.
