engineering judgments have been included to fit Ohio's conditions. The pavement design procedures relate the performance of a pavement to its structural design and the loading applied to the pavement. Failure mechanisms derived from poor mix design, poor material quality, or poor construction practices are not addressed in this manual.

They determine an existing pavement's structure, confirm its structural adequacy and help determine why it failed and how it will perform with various maintenance alternatives. Pavement evaluations are invaluable in determining the best and most economical pavement design and rehabilitation approach based on an annual cost analysis.

The R-Value test measures the response of a compacted sample of soil or aggregate to a vertically applied pressure under specific conditions. This test is used by Caltrans for pavement design, replacing the California bearing ratio test. Many other agencies have adopted the California pavement design method, and specify R-Value testing for subgrade soils and road aggregates.
