4). Creating Hard Keypoints: Hard points are often used when you need to apply a constraint or load at a location where a keypoint does not exist. For this case, we want to apply a force  $\frac{3}{4}$  of the way down the beam. Since there are not any keypoints here and we can't be certain that one of the nodes will be here we will need to specify a hard point.

You can return a structure from a function (or use the = operator) without any problems. It's a well-defined part of the language. The only problem with `struct b = a` is that you didn't provide a complete type. `struct MyObj b = a` will work just fine. You can pass structures to functions as well - a structure is exactly the same as any built-in type for purposes of parameter passing, return ...
