Adapted from p. 1-2 of the F-1 Rocket Engine Technical Manual Supplement (R-3896-1A) Adaptation by heroicrelics. In addition to its duties in sustaining proper combustion, the injector also played a role in the initial ignition of the engine. The F-1's propellants, RP-1 and LOX, require an external ignition source to initiate combustion.

The F-1 Rocket Engine

A rocket engine uses stored rocket propellant mass for forming its high-speed propulsive jet. Rocket engines are reaction engines, obtaining thrust in accordance with Newton's third law. Most rocket engines use combustion, although non-combusting forms (such as cold gas thrusters) also exist. Vehicles propelled by rocket engines are commonly called rockets.

The thrust chamber is the most recognizable portion of the F-1 rocket engine. While the entire thrust chamber assembly consists of a gimbal bearing, an oxidizer dome, an injector, a thrust chamber body, a thrust chamber nozzle extension, and thermal insulation, this page will deal with the thrust chamber itself. This page will additionally refer to the thrust chamber body, without its nozzle ...
