Norton's theorem says that a linear two-terminal electric circuit may be exchanged with a Norton equivalent circuit consisting of a current source,  $I_N$ , in parallel with a Norton resistor  $R_N$ . Where  $I_N$  is the short-circuit current through the terminals load resistor and  $R_N$  is equivalent resistance at the terminals when all the independent sources are turned off.

Summary. A network, in the context of electronics, is a collection of interconnected components. Electric Circuit analysis is the process of finding the voltages across, and the currents through, every component in the network. There are many different techniques for calculating these values. However, for the most part, the applied technique assumes that the components of the network are all ...

Nodal analysis is a circuit analysis technique and is based on Kirchhoff's Current Law (KCL) with coordination of Ohm's law. The analysis uses node voltage instead of element voltage in the circuit, that's why it is called Nodal Analysis.. Where nodes are the junction part of the electric circuit which connect multiple components to each other.
